

Bioanalytical Techniques

The quantitative and qualitative analysis of drugs in biological matrix, such as whole blood, plasma, serum, urine, saliva, feces, sputum and various discrete tissues, has witnessed immense attention in recent years. In particular analysis of drugs in biological matrix i.e. bioanalytical method, has major role both in the development of more selective and effective drugs and in understanding their therapeutic and toxic effects. It also provides a basis for bioavailability, toxicokinetic, tissue distribution, pharmacokinetics, clinical, bioequivalence, biopharmaceutics studies and the influences of co-medications that have to be known for new drug to be approved.

The Bioanalysis in combination with liquid chromatography is utilized for the fast and efficient quantitation of small molecules, peptides, and proteins in complex matrices such as plasma, blood, urine, feces, and tissue. This combination can analyze compounds that lack a specific chromophore. **Bioanalytical-techniques-review-journals OMICS Group**
